PDF forms and SharePoint are better together

Bringing people picker to front

This guide will describe how to “Bring to Front” people picker control. Controls on each PDF form are loaded one by one and control which was loaded last will be placed above all others. Here will be showed how to change loading sequence of controls.

Step 1. Create a template

Following form has submit button and people picker, as it is see from “Hierarchy”, people picker was placed on the form first, then submit button.

NOTE:

- People picker must be higher in “Hierarchy”, than submit button;
- Submit button must be placed right under people picker popup list reaching zone.

Step 2. Add values to people picker (PDF Form Tools → Properties → People Source):

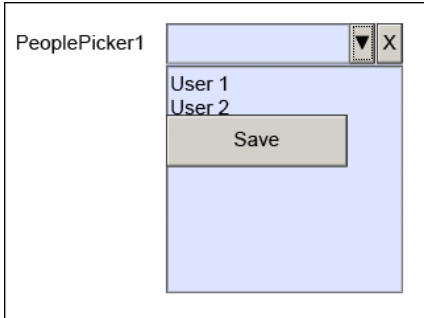

In this example users were added manually.

Step 3. Save template and deploy

Step 4. Create new form from deployed template:

Open people picker:

As it can be seen, “Save” button is rendered above people picker’s popup menu. That is because people picker was placed higher in “Hierarchy”, then submit button. This means that submit button was rendered after people picker.

Step 5. Switch back to Designer

Step 6. Place people picker below submit button in “Hierarchy”

This can be achieved by clicking on people picker icon in “Hierarchy” and dragging under submit button icon while picture under cursor will not be changed from red X to green tick:

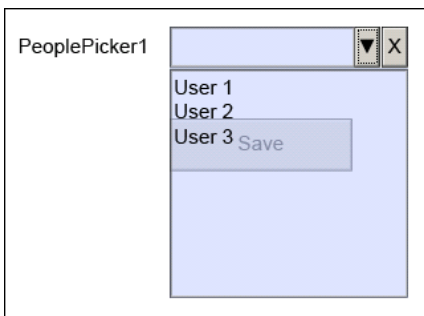

Now people picker will be loaded after submit button.

Step 7. Save template and deploy

Step 8. Create new form from deployed template:

Open people picker:

Now people picker is loaded after submit button and popup menu is above the button.

NOTE: following behavior applies only to people picker control duo to its complicated structure, popup menus from regular dropdown fields are not affected by the process described above.
