“Execute C# script” action’s script in the Form Submit rules	9

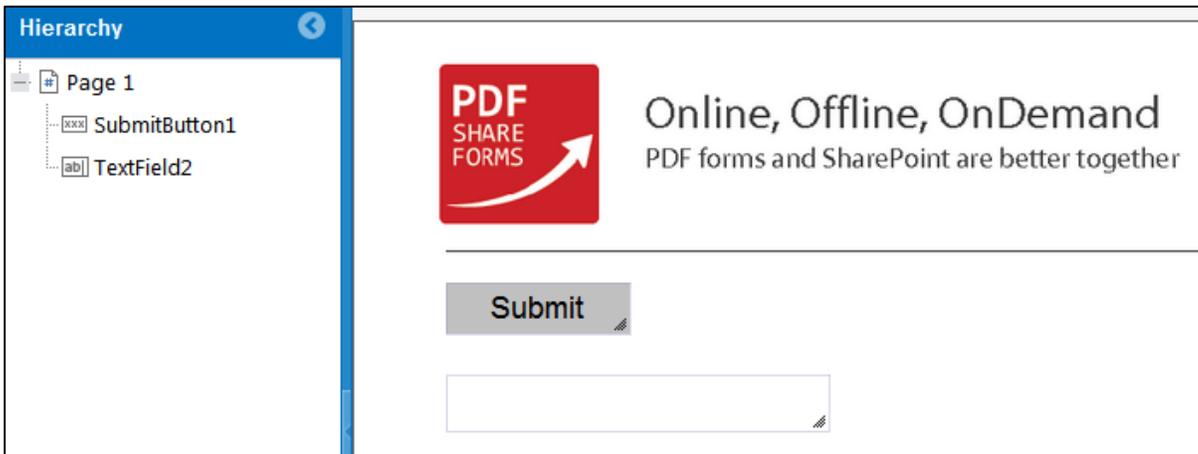

This guide shows how to create a folder with a user-selected name and submit a form into this folder. Method contains server-side and client-side scripting.

PDF Share Forms Enterprise for SharePoint 2013

Static (Acro) and Dynamic (XFA) forms

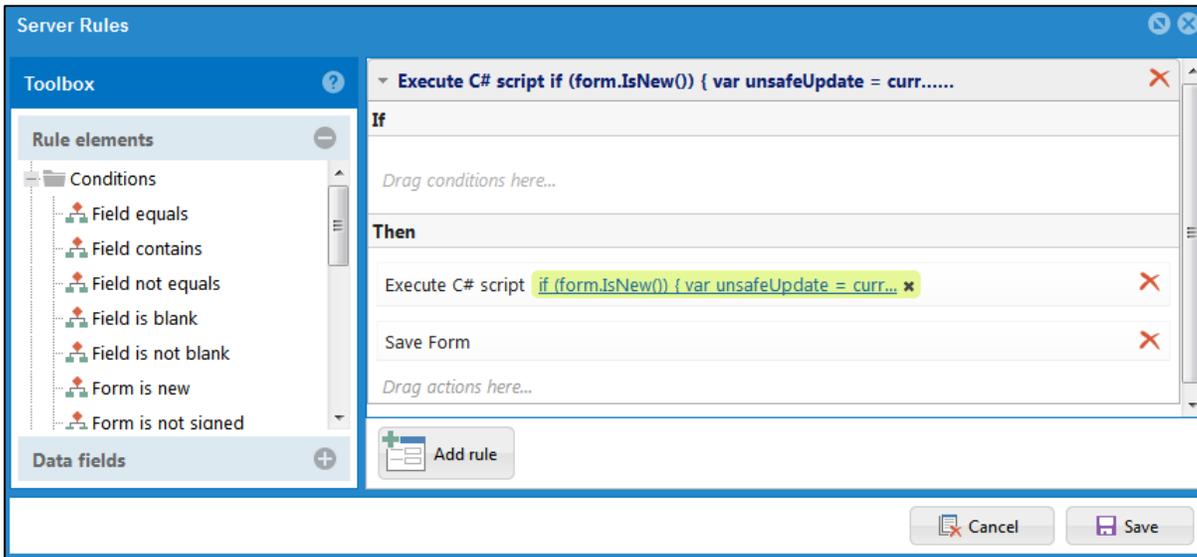

This approach works both for static and dynamic forms.

Step 1. Template

- “Submit” – button for form submitting;
- “TextField2” – value from this field is used to set a name of the target folder.

Step 2. Add “Execute C# script” action before “Save Form” action in Form Submit rules. Navigate to **Developer** → **Form Submit**

Script

```

if (form.IsNew()) {
    var unsafeUpdate = currentWeb.AllowUnsafeUpdates;
    currentWeb.AllowUnsafeUpdates = true;
    var folderName = data.resolveNode("TextField2").Value;
    var getExisting =
currentWeb.GetFolder(String.Format("{0}/YourListName/"+data.resolveNode("TextField2").Value,
currentWeb.Url)); //this line of code searches for a folder by its name
//. If the folder does not exist then a new folder is created and the form will be submitted into it
    if(!getExisting.Exists){
        SPList list = currentWeb.Lists["YourListName"]; //list name should be specified for a proper
case
        SPListItem folder = list.AddItem(list.RootFolder.ServerRelativeUrl,
SPFileSystemObjectType.Folder, folderName);
        folder.Update();
        data.GetSystemField("FolderID").Value= folder.UniqueId.ToString();
    }
//if the folder exists then the form is submitted into it
    else data.GetSystemField("FolderID").Value= getExisting.UniqueId.ToString();
    currentWeb.AllowUnsafeUpdates = unsafeUpdate;
}
//sets redirection to created folder
data.GetSystemField("RedirectURL").Value =
String.Format("{0}/YourListName/"+data.resolveNode("TextField2").Value, currentWeb.Url);

```

This script checks if the folder with the name that is taken from “TextField2” already exists. If the folder exists then the form will be submitted to this folder. If the folder does not exist, then a new folder is created and the form will be submitted into it. In addition, user is redirected to submission folder.

Step 3. Deploy template.

Step 4. Open new form and add value to “TextField2”.

PDF forms and SharePoint are better together

Submit

Hello World

Click submit.

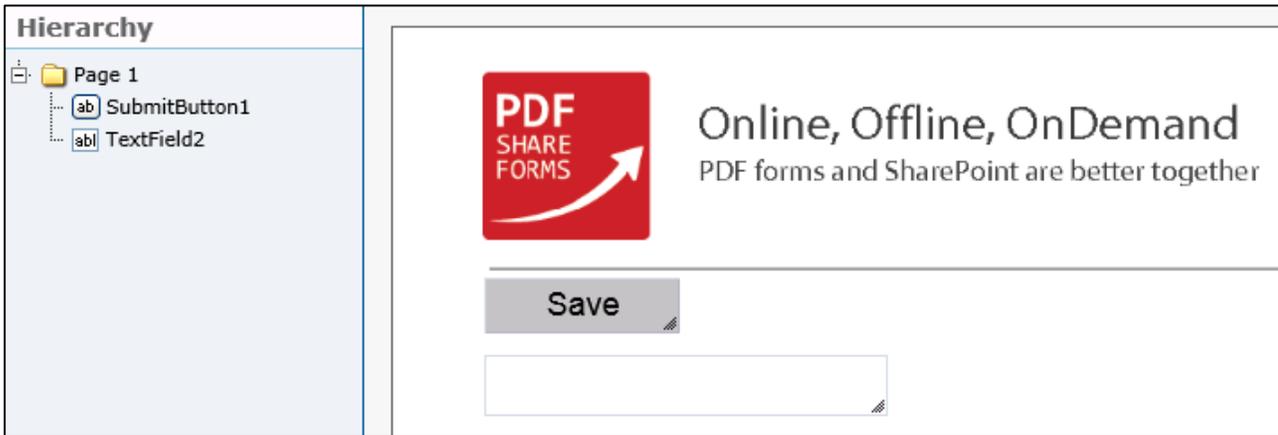

Step 4.1 New folder named “Hello World” is created and the form is submitted into this folder

PDF Share Forms Enterprise for SharePoint 2010

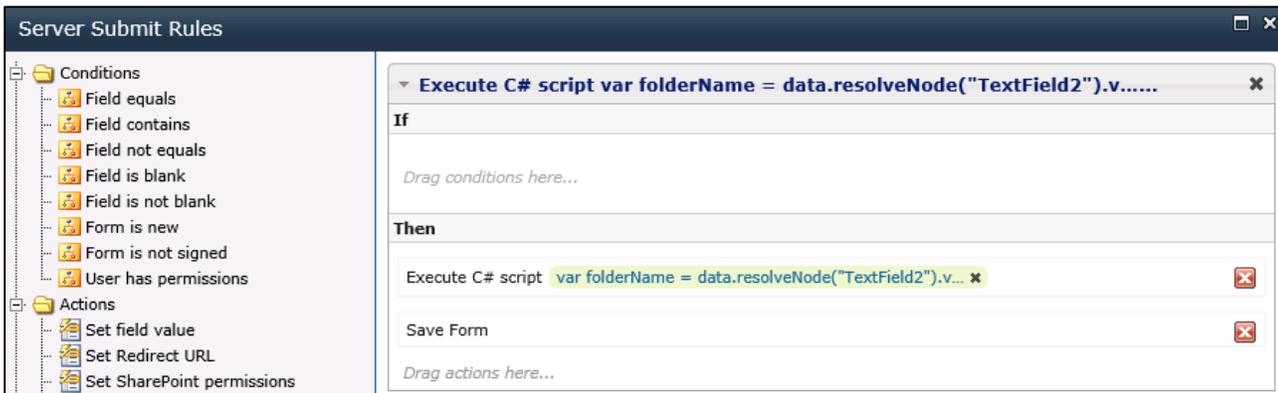

Static (Acro) form

Step 1. Template

- ✔ “SubmitButton1” – button for form submitting;
- ✔ “TextField2” – value from this field is used to set a name of the target folder.

Step 2. Add “Execute C# script” action before the “Save Form” action in Form Submit rules. Navigate to **Developer** → **Form Submit**

Script

Step 3. Add “JavaScript action” to the submit button. Choose the button and navigate to **PDF Form Tools → Properties → Actions →** place “JavaScript action” above “Submit to SharePoint” action.

Script

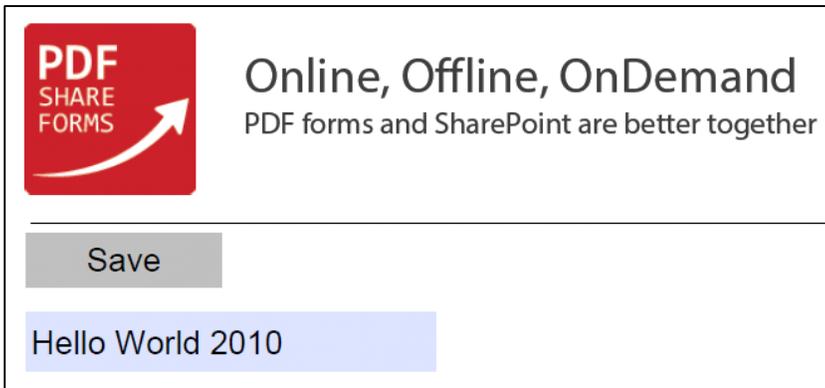

```
this.getField("PDFSPSystemData").value =
this.getField("PDFSPSystemData").valueAsString.replace("\\\\"RootFolder\\\\":\\\\"/YourRootFolder\\\\"
", "\\\\"RootFolder\\\\":\\\\"/YourRootFolder/" + this.getField("TextField2").value + "\\\\"");
```

This code changes submit URL to save form into newly created folder.

NOTE: “YourRootFolder” is a part of your site’s library URL. For example: [/sites/demo/Guides](#)

Step 4. Deploy the template.

Step 5. Create a new form and fill in the “TextField2”.

Submit the form.

Step 6. New folder is created and form is submitted into it

<input type="checkbox"/>	Type	Name	Modified	<input type="checkbox"/>	Modified By
<input type="checkbox"/>	Folder	Hello World 2010	5/26/2015 3:38 AM	<input type="checkbox"/>	DEMO\administrator

[+ Add document](#)

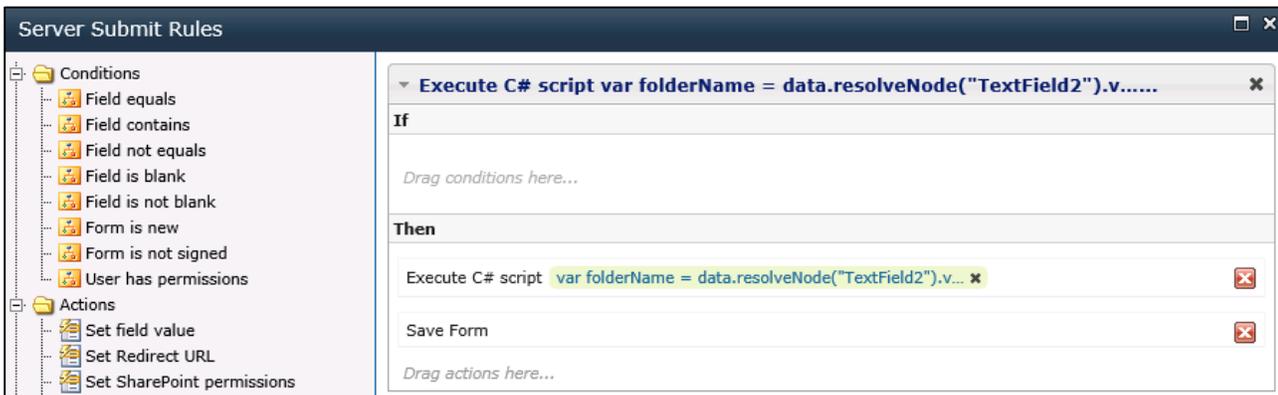

Dynamic (XFA) form

Step 1. Create template

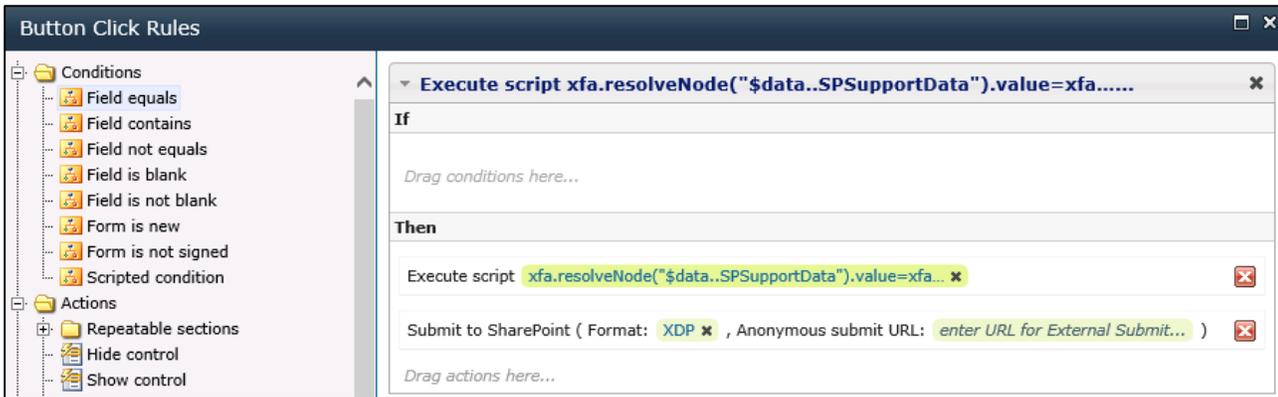

- “SubmitButton1” – button for form submitting;
- “TextField2” – value from this field is used to set the name of a target folder.

Step 2. Add “Execute C# script” action before the “Save Form” action in Form Submit rules. Navigate to **Developer** → **Form Submit**

Script

Step 3. Add “Execute script” action to the submit button. Choose button and navigate to **PDF Form Tools → Properties → Actions →** place “Execute script” action above “Submit to SharePoint” action.

Script

```
xfa.resolveNode("$data..SPSupportData").value=xfa.resolveNode("$data..SPSupportData").value.replace(/"RootFolder":([\"])(\\?.)*?\1/g,"\"RootFolder\": \" /YourRootFolder/ "+xfa.resolveNode("$data..TextField2").value+"\"");
```

This code changes submit URL to save form into newly created folder.

NOTE: “YourRootFolder” is a part of your site’s library URL. For example: [/sites/demo/Guides](#)

Step 4. Deploy the template.

Step 5. Create a new form and fill in “TextField2”.

Submit the form.

Step 6. New folder is created and form is submitted into it.

<input type="checkbox"/> Type	Name	Modified	<input type="checkbox"/> Modified By
	Hello World 2010_2	5/27/2015 4:23 AM	DEMO\administrator

[+ Add document](#)

“Execute C# script” action’s script in the Form Submit rules

```
if (form.IsNew()) {
    var unsafeUpdate = currentWeb.AllowUnsafeUpdates;
    currentWeb.AllowUnsafeUpdates = true;
    var folderName = data.resolveNode("TextField2").value;
    var getExisting =
currentWeb.GetFolder(String.Format("{0}/YourListName/"+data.resolveNode("TextField2").Value,
currentWeb.Url));//this line of searches for a folder by its name
// If the folder does not exist then a new folder is created and the form will be submitted into it
    if(!getExisting.Exists){
        SPList list = currentWeb.Lists["YourListName"];//list name should be specified for a proper
case
        SPListItem folder = list.AddItem(list.RootFolder.ServerRelativeUrl,
SPFileSystemObjectType.Folder, folderName);
        folder.Update();
        data.GetSystemField("FolderID").Value= folder.UniqueId.ToString();
    }
    //if the folder exists then form is submitted into it
    else data.GetSystemField("FolderID").value= getExisting.UniqueId.ToString();
    currentWeb.AllowUnsafeUpdates = unsafeUpdate;
}
```

This script checks if the folder with the name that is taken from “TextField2” already exists. If the folder exists then the form will be submitted to the existing folder. If the folder does not exist then a new folder is created and the form will be submitted into it.
