

Using a form with controls based on Master Page as a base for a template

This guide describes the steps to import a PDF file that has controls (fillable fields) on the Master Page and use it as a base for dynamic template.

Step 1. Create new dynamic PDF template and select **Template From Existing PDF File** in template type menu. Select your PDF file which you wish to import as a base and complete the creation procedure.

Step 2. Edit your template.

Step 3. Add information about controls located on the Master Page to the template. Switch view to Master Pages: **PDF Form Tools** → **Page Design** and back to **Normal** view. Once you did it, you will see loading screen while switching between these views. These actions will save all elements which are currently placed on the Master Pages.

Step 4. Deploy your template to a library.
